Historical Perspectives on Food, Health, and Prosperity

Nathan Nunn Professor of Economics Harvard University

May 31, 2012

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Importance of Food and Nutrition

- Contemporary importance is clear, particularly for developing countries.
- However, historically food has played a very important role in shaping the evolution of societies.

And, these historical impacts continue to matter today.

The Historical Impacts of Food

- 1. **Columbian Exchange**: involved the transfer of food crops between the New and Old Worlds.
 - **Potatoes** brought to the Old World.
 - Increased health and prosperity.
 - Sugar plantations established in the New World.
 - Led to underdevelopment in the Americas, but increased welfare in Europe.
- 2. Traditional Agricultural Technology: shaped by the crops a society was endowed with.
 - Some crops were particularly well suited for intensive plough agriculture, rather than shifting hoe agriculture.
 - Plough agriculture significantly decreased female participation in work outside the home.
 - And this in turn, affected the evolution of beliefs about the unequal roles of men and women in societies.

Columbian Exchange

Average Daily Consumption (calories)		Annual Production (millions of tonnes)	Land Harvested (millions of hectares)		
Rice	567	Sugar cane	1,252.5	Wheat	215.5

Panel B: Ten Largest Producers of Old World Foods

Native Andean Potato Breeds

Is there Something Special about the Potato?

In the Wealth of Nations, Adam Smith wrote:

- "the food produced by a field of potatoes is...much superior to what is produced by a field of wheat...No food can afford a more decisive proof of its nourishing quality, or of its being peculiarly suitable to the health of the human constitution."
- And historians have even asserted that:
 - "Potatoes, by feeding rapidly growing populations, permitted a handful of European nations to assert domination over most of the world between 1750 and 1950...It is certain that without potatoes, Germany could not have become the leading industrial and military power of Europe after 1848, and no less certain that Russia could not have loomed so threateningly on Germany's eastern border after 1891." (McNeill, 1999)

TABLE I Average Crop Yields of English Farms in the Eighteenth Century

	Average yield per acre		Energy value of crop	Acres of land needed to provide 42 megajoules per
	Bushels	Kilograms	Megajoules	day for one year
Wheat	23	650	8,900	1.70
Barley	32	820	11,400	1.40
Oats	38	690	9,300	1.60
Potatoes	427	10,900	31,900	0.50

Notes. Data are from eighteenth-century England, recorded in Young's (1771, p. 20) The Farmer's Tour through the East of England, Volume 4; reproduced in Davidson et al. (1975).

Quantifying the Impacts of the Potato on Health and Prosperity

- But did the diffusion of the potato really have large impacts in the Old World?
- In Nunn and Qian (QJE, 2011) we attempt to empirically quantify the impact of the potato on Old World population, city growth, and adult heights.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The FAO Data

- Data on the suitability for potato cultivation are taken from the Global Agro-Ecological Zones (GAEZ) 2002 database.
 - Provides information on suitability for growing different crops across 50km × 50km grid cells.
 - Constructed by combining information on crop-specific growing constraints with detailed grid-cell level GIS data on the temperature, rainfall, sunlight, and soil.

We define land that can obtain at least 40% of the maximum yield as being suitable for potato cultivation.

Figure II: Average potato suitability in the Old World.

Flexible Estimating Equation

$$y_{it} = \sum_{j=1100}^{1900} \beta_j \ln Potato Area_i \cdot l_t^j + \sum_{j=1100}^{1900} \mathbf{X}_i' \mathbf{I}_t^j \Phi_j$$
$$+ \sum_c \gamma_c \, l_i^c + \sum_{j=1100}^{1900} \rho_j \, l_t^j + \varepsilon_{it}$$

- In Potato Area; is the log of land area suitable for the cultivation of the potatoes.
- $\sum \mathbf{X}'_i \mathbf{I}'_t$ is a vector of controls interacted with time-period FEs.
- I_i^c are country fixed effects
- ▶ I^j_t are time period fixed effects: 1000, 1100, 1200, 1300, 1400 1500, 1600, 1700 1750, 1800, 1850, 1900

R-squared	0.23	0.23	0.23	0.24			

- Potatoes increased living standards, health and prosperity.
- Contemporary evidence suggests that increased prosperity is associated with decreased conflict.
- Initial findings suggest that within Europe the introduction of the potato also led to a decline in conflict (inter-state and intra-state).

Subsequent Research on the Columbian Exchange

Shuo Chen and James Kung (2011): "The Malthusian Quagmire: Maize and Population Growth in China, 1500–1900"

Show that the adoption of maize in China increased population but not urbanization rates.

Ruixue Jia (2011): "Weather Shocks, Sweet Potatoes and Peasant Revolts in Historical China"

- Documents a positive relationship between droughts and peasant revolts (floods have no effect) between 1470 and 1900.
- The adoption of the sweet potato, because of its drought resistance, severed the link between drought and conflict.

Sugar and the Columbian Exchange

The Benefits of the Sugar Boom in Europe

- Sugar provided a cheap source of calories consumed by all classes.
- Hersch and Voth (2011) consider the welfare impacts of greater access to sugar due to its mass cultivation in the Americas.

They estimate that between 1600 and 1850, sugar consumption increased welfare by 7.5-8.0%.

Crops and Traditional Agriculture

- Our examination of the Columbian Exchange illustrates the historical impacts of food on health and prosperity.
- Alesina, Giuliano and Nunn (2011) consider an alternative (perhaps less obvious) persistent impact of traditional food crops.
- ► Hypothesis: Crops ⇒ Agricultural technology ⇒ Female participation in agriculture ⇒ Persistent norms regarding female work outside the home.

Plough Agriculture

Hoe Agriculture

Crops and plough use

- There are differences in the extent to which crops benefit from the introduction of the plough.
- ► Factors identified in the anthropological literature include:
 - Length of planting season.
 - Frequency of planting.
 - Amount of land to be prepared.
 - Qualities/characteristics of the soil that crops can be grown in (sloped, rocky, swampy, clayey vs. loamy, depth, etc).
- Pryor (1985) groups crops into two categories:
 - 1. **Plough-positive crops**: teff, wheat, barley, rye, buckwheat, wet rice, and industrial crops.
 - 2. **Plough-negative crops**: millet, sorghum, root crops, maize, dry rice and tree crops.

Barley

Rye

Wheat

Plough Agriculture

	Dependent variable: Participation of females relative to males in the following tasks:									
	Overall agriculture		Land clearance	Soil preparation	Planting	Crop tending	Harvesting			
_	(1)	(2)	(3)	(4)	(5)	(6)	(7)			
Traditional plough agriculture	-0.861***	-1.133***	-0.414**	-1.164***	-1.244***	-1.033***	-0.770**			
	(0.217)	(0.272)	(0.200)	(0.355)	(0.341)	(0.367)	(0.308)			
Ethnographic controls	yes	yes	yes	yes	yes	yes	yes			
Observations	660	124	129	124	131	122	131			
R-squared	0.14	0.22	0.15	0.13	0.13	0.19	0.19			

Table: Was plough agriculture associated with a gender division of labor?

Notes: The unit of observation is an ethnic group. In column 1 ethnic groups are from the *Ethnographic Atlas* and in columns 2-7 they are from the *Standard Cross Cultural Sample*. Each dependent variable measures female participation in a particular activity (e.g., agriculture). The variables take on integer values between 1 and 5 and are increasing in female participation. Coefficients are reported with robust standard errors in brackets. In column 1, we report Conley standard errors adjusted for spatial correlation (assuming a window that is sixty degrees latitude and sixty degrees longitude). ***, *** and * indicate significance at the 1,5 and 10% levels.

Outcomes of interest

Female labor force participation:

- 1. Proportion of women in the labor force (employed or seeking employment).
- 2. Beliefs: "When jobs are scarce, men should have more right to a job than women"
 - ► (i) agree, (ii) neither (iii) disagree
 - ► Variable equals 1 if agree, and 0 if disagree.

Female representation in positions of power:

- 1. Proportion of firm owners/managers that are female.
- 2. Proportion of seats in national parliament held by women.
- 3. Beliefs: "On the whole, men make better political leaders than women"
 - (i) strongly disagree, (ii) disagree, (iii) agree, (iv) strongly agree
 - Variable takes on values 1, 2, 3, 4.

FLFP

Observations	163	163	106	106	144	144	138°	138°	
R-squared	0.413	0.426	0.132	0.208	0.358	0.392			

Table: Country-level OLS estimates.

Notes: OLS estimates are reported with robust standard errors in brackets. The unit of observation is a country. ***, ** and * indicate significance at the 1, 5 and 10% levels.

^aThis is the average number of observations in the regressions for the three outcomes.

Figure: Partial correlation plot: Dep var is FLFP

Figure: Partial correlation plot: Dep var is share of firms with female ownership

Figure: Partial correlation plot. Dep var is share of national seats held by women

ъ

Summary: The Historical Impacts of Food

- 1. **Columbian Exchange**: involved the transfer of food crops between the New and Old Worlds.
 - **Potatoes** brought to the Old World.
 - Increased health and prosperity.
 - Sugar plantations established in the New World.
 - Led to underdevelopment in the Americas, but increased welfare in Europe.
- 2. **Traditional Agricultural Technology**: shaped by the crops a society was endowed with.
 - Some crops were particularly well suited for intensive plough agriculture, rather than shifting hoe agriculture.
 - Plough agriculture significantly decreased female participation in work outside the home.
 - And this in turn, affected the evolution of beliefs about the unequal roles of men and women in societies.
